They behave socially at the level of choices about what to buy or do in a social context and individually at the level of choices about what they will do in a personal context. The range and intensity of choices about how to behave have increased in recent decades, and they have had a significant impact on their personal and professional lives. developments are implemented by
teams. This requires a lot of overhead
to set up, manage, and ensure that
people work on the development of a
common code base. Over time, these

teams grow and expand into many or all of the previously independent teams. While these teams are working together, one of the biggest obstacles is maintaining a common understanding of what a change is affecting, both among the different teams, and across teams inside the development organization. As the independent teams start to communicate with each other, they learn and invent different names for different parts of the code, unless they find a name that is both transparent and accurate. For the most part, it is like the growth of a dynamic, large,

code base is split into many independent, unconnected systems. This is a problem because even a common source code base gets more complex as it grows. After some time, it is inevitable that the different names that the teams are using for their own part of the code base will start to affect how changes are made to the code base. If two developers are modifying the same code, it is very easy for them to understand what they are doing, what the outcome is, and how they can communicate about this. However, if they can't communicate what they are doing, they have a much

harder time of it. Thus, the solution is to use a name-to-definition and definition-to-name mapping. It is generally not possible to define all of the names that a development organization is using for parts of
